1. General Methods.

Biotage SP1™ purification system and flash cartridges were used for flash column chromatography. Thin-layer chromatography was carried out on precoated aluminum-backed TLC sheets (silica gel 60 F254, EMD chemicals, San Diego, CA). Compounds were visualized with a ninhydrin spray reagent or a UV/vis lamp. $^1$H and $^{13}$C NMR spectra were recorded on a Bruker 500 MHz NMR spectrometer. Chemical shifts were reported as δ values in parts per million downfield from TMS (δ 0.0) as the internal standard in CDCl$_3$. All reagents were purchased from Sigmaaldrich, Fisher and Novabiochem. They were used without further purification unless stated otherwise. (R)-(+)-tert-Butanesulfinamid was purchased from Advanced Asymmetrics, Inc., IL, USA. (S)-α-Methyl-4-nitrobenzylamine hydrochloride was purchased from TCI America, OR, USA. $N,N'$-Diisopropylcarbodiimide was purchased from Advanced ChemTech, KY, USA.

The peptoid oligomers were synthesized by solid-phase submonomer method on solid support using an automated synthesis (Aapptec Apex 396 parallel synthesizer, Louisville, KY, USA) or a manual synthesis. Rink amide resin (0.60 mmol/g, Novabiochem, San Diego, CA, USA) was used to generate C-terminal amide peptoids. After Fmoc deprotection, each monomer was added by a series of bromoacetylation and displacement by a primary amine. These two steps were iterated with appropriate primary amines until desired peptoid sequence was obtained. Typically, 0.06 mmol reaction scale was used (0.1 g of the resin). For bromoacetylation, the addition of bromoacetic acid (1 mL, 1.2 M in DMF, 1.2 mmol) followed by $N,N'$-diisopropylcarbodiimide (0.15 mL, neat, 1.0 mmol), and then agitation at room temperature for 20 min were performed. For the displacement reaction, primary amine (1 mL, 1.2 M in NMP or $N$-methylpyrrolidone) was added, and the reactor was agitated at room temperature for 1 h. The resin was washed with DMF (6 mL × 5) between each step. $N$-Terminal acetylation was performed manually by adding acetic anhydride (0.12 mL, 1.3 mmol) and pyridine (0.13 mL, 1.6 mmol) to the resin-bound peptoid in DMF (1 mL). The reaction was continued at room temperature for 2 hours. Peptoid 20 was cleaved from the resin with 42.5:50:5:2.5 TFA/CH$_2$Cl$_2$/water/triisopropylsilane (v/v/v/v) for 5 minutes at room temperature. Other peptoids
were cleaved with 95:2.5:2.5 TFA/water/triisopropylsilane (v/v/v) for 10 - 20 minutes at room temperature (i.e. longer TFA treatment was applied for tert-butyl ester deprotection). The cleavage solution was filtered by solid-phase extraction (SPE) cartridges (Applied Separations, Allentown, PA, USA) and the volatiles were removed by a stream of nitrogen. The crude peptoid was dissolved in acetonitrile and analyzed by ESI, Maldi-TOF, and analytical HPLC.

LC-MS data were obtained using an Agilent Technologies 1100 Series and LC/MSD Trap XCT system (Agilent Technologies, Santa Clara, CA, USA). Vydac C4 column was used with mobile phase of water (0.1% TFA) and acetonitrile (0.1% TFA). The Maldi-TOF mass spectra were obtained by an Applied Biosystems 4800 MALDI TOF/TOF Analyzer system (Applied Biosystems, Foster City, CA, USA). α-Cyano-4-hydroxycinnamic acid (5 mg/mL in CH3CN/H2O = 1:1 with 0.1% TFA) was used as the matrix. Analytical HPLC was performed on a Varian modular HPLC system (ProStar 210 solvent delivery system, ProStar 325 UV-Vis dual wavelength detector, autosampler model 430, and column oven model510). Sample purity was monitored by absorbance at 220 nm. Grace Vydac protein & peptide C18 column (cat #: 218TP5415) was used for the analytical HPLC. The peptoids were purified by preparative HPLC system (Varian ProStar 210 solvent delivery system, ProStar 345 UV-Vis detector, fraction collector model 210) using a C18 column [Varian Dynamax, 250×21.4 mm, Omnispher 5] at a flow rate of 10 mL/min. Sample elution was detected by absorbance at 220 nm. The mobile phase was used as follows: (A, water + 0.1% TFA; B, CH3CN + 0.1% TFA) 5 min using 5% B, then a gradient to 99% B over 35 min, 5 min using 99% B, and then a gradient to 5% B over 5 min. For peptoid 20 - 22, acetonitrile and water were degassed and TFA was added. The purity of the product fractions were confirmed by analytical HPLC, and fractions containing pure product were collected, lyophilized, and stored at -80 °C.

Circular dichroism measurements were carried out at 25 °C with a Jasco J-815 circular dichroism spectrometer (Jasco, Inc., Easton, MD, USA). CD spectra were obtained in an 1 mm pathlength quartz cell and recorded from 190 to 260 nm in 1 nm increments with a scanning speed of 20 nm/min and a response time of 4 second. Three scans for each sample were averaged. Stock
solutions of peptoids (1 - 5 mM in acetonitrile) were used, and appropriate dilutions were made immediately before the measurements. Sample concentrations were in the range of 46 - 50 μM. Data are expressed in terms of per-residue molar ellipticity (deg cm²/dmol) calculated per number of amides in a molecule.
